Chapter 1

Outline

This is the C++ API documentation of bliss, produced by running `doxygen` in the source directory.

The algorithms and data structures used in bliss, the graph file format, as well as the compilation process can be found at the [bliss web site](#).

The C++ language API is the main API to bliss. It basically consists of the public methods in the classes

- [bliss::Graph](#) and
- [bliss::Digraph](#).

For an example of its use, see the [source of the bliss executable](#).

1.1 The C language API

The C language API is given in the file [bliss_C.h](#). It is currently only a subset of the C++ API, so consider using the C++ API whenever possible.

Chapter 2

The bliss executable

Chapter 4

Hierarchical Index

4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

bliss::AbstractGraph	17
bliss::Digraph	27
bliss::Graph	35
bliss::BigNum	23
bliss_graph_struct	25
bliss_stats_struct	25
bliss::Partition::Cell	26
bliss::Heap	43
bliss::KQueue< Type >	45
bliss::KQueue< bliss::Partition::Cell * >	45
bliss::Orbit	47
bliss::Partition	49
bliss::Stats	52
bliss::Timer	53
bliss::UIntSeqHash	54

Chapter 5

Class Index

5.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

bliss::AbstractGraph	An abstract base class for different types of graphs	17
bliss::BigNum	A simple wrapper class for non-negative big integers (or approximation of them)	23
bliss_graph_struct	The true bliss graph is hiding in this struct	25
bliss_stats_struct	The C API version of the statistics returned by the bliss search algorithm	25
bliss::Partition::Cell	Data structure for holding information about a cell in a Partition	26
bliss::Digraph	The class for directed, vertex colored graphs	27
bliss::Graph	The class for undirected, vertex colored graphs	35
bliss::Heap	A min-heap of unsigned integers	43
bliss::KQueue< Type >	A simple implementation of queues with fixed maximum capacity	45
bliss::Orbit	A class for representing orbit information	47
bliss::Partition	A class for refinable, backtrackable ordered partitions	49
bliss::Stats	Statistics returned by the bliss search algorithm	52
bliss::Timer	A simple helper class for measuring elapsed time	53
bliss::UIntSeqHash	A updatable hash for sequences of unsigned ints	54

Namespace Documentation

7.1 bliss Namespace Reference

Classes

- class [AbstractGraph](#)
An abstract base class for different types of graphs.
- class [BigNum](#)
A simple wrapper class for non-negative big integers (or approximation of them).
- class [Digraph](#)
The class for directed, vertex colored graphs.
- class [Graph](#)
The class for undirected, vertex colored graphs.
- class [Heap](#)
A min-heap of unsigned integers.
- class [KQueue](#)
A simple implementation of queues with fixed maximum capacity.
- class [Orbit](#)
A class for representing orbit information.
- class [Partition](#)
A class for refinable, backtrackable ordered partitions.
- class [Stats](#)
Statistics returned by the bliss search algorithm.
- class [Timer](#)
A simple helper class for measuring elapsed time.
- class **TreeNode**
- class [UIntSeqHash](#)
A updatable hash for sequences of unsigned ints.

Functions

- [size_t print_permutation](#) ([FILE *const fp](#), [const unsigned int N](#), [const unsigned int *perm](#), [const unsigned int offset](#))
- [size_t print_permutation](#) ([FILE *const fp](#), [const std::vector< unsigned int > &perm](#), [const unsigned int offset](#))
- [bool is_permutation](#) ([const unsigned int N](#), [const unsigned int *perm](#))
- [bool is_permutation](#) ([const std::vector< unsigned int > &perm](#))

Variables

- `static const char *const version = "0.77"`

The version number of bliss.

7.1.1 Detailed Description

The namespace `bliss` contains all the classes and functions of the bliss tool except for the C programming language API.

7.1.2 Function Documentation

7.1.2.1 `is_permutation()` [1/2]

```
bool bliss::is_permutation (
    const std::vector< unsigned int > & perm )
```

Check whether *perm* is a valid permutation on {0,...,N-1}. Slow, mainly for debugging and validation purposes.

7.1.2.2 `is_permutation()` [2/2]

```
bool bliss::is_permutation (
    const unsigned int N,
    const unsigned int * perm )
```

Check whether *perm* is a valid permutation on {0,...,N-1}. Slow, mainly for debugging and validation purposes.

7.1.2.3 `print_permutation()` [1/2]

```
size_t bliss::print_permutation (
    FILE * fp,
    const std::vector< unsigned int > & perm,
    const unsigned int offset = 0 )
```

Print the permutation *perm* of {0,...,N-1} in the cycle format in the file stream *fp*. The amount *offset* is added to each element before printing, e.g. the permutation (2 4) is printed as (3 5) when *offset* is 1.

7.1.2.4 `print_permutation()` [2/2]

```
size_t bliss::print_permutation (
    FILE * fp,
    const unsigned int N,
    const unsigned int * perm,
    const unsigned int offset = 0 )
```

Print the permutation *perm* of {0,...,N-1} in the cycle format in the file stream *fp*. The amount *offset* is added to each element before printing, e.g. the permutation (2 4) is printed as (3 5) when *offset* is 1.

8.1.1 Detailed Description

An abstract base class for different types of graphs.

8.1.2 Member Function Documentation

8.1.2.1 add_edge()

```
virtual void bliss::AbstractGraph::add_edge (
    const unsigned int source,
    const unsigned int target ) [pure virtual]
```

Add an edge between vertices *source* and *target*. Duplicate edges between vertices are ignored but try to avoid introducing them in the first place as they are not ignored immediately but will consume memory and computation resources for a while.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.2 add_vertex()

```
virtual unsigned int bliss::AbstractGraph::add_vertex (
    const unsigned int color = 0 ) [pure virtual]
```

Add a new vertex with color *color* in the graph and return its index.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.3 canonical_form()

```
const unsigned int * bliss::AbstractGraph::canonical_form (
    Stats & stats,
    const std::function< void(unsigned int n, const unsigned int *aut)> & report =
nullptr,
    const std::function< bool()> & terminate = nullptr )
```

Otherwise the same as [find_automorphisms\(\)](#) except that a canonical labeling of the graph (a bijection on $\{0, \dots, \text{get_nof_vertices}() - 1\}$) is returned. The memory allocated for the returned canonical labeling will remain valid only until the next call to a member function with the exception that constant member functions (for example, [bliss::Graph::permute\(\)](#)) can be called without invalidating the labeling. To compute the canonical version of an undirected graph, call this function and then [bliss::Graph::permute\(\)](#) with the returned canonical labeling. Note that the computed canonical version may depend on the applied version of bliss as well as on some other options (for instance, the splitting heuristic selected with [bliss::Graph::set_splitting_heuristic\(\)](#)).

If the *terminate* function argument is given, it is called in each search tree node: if the function returns true, then the search is terminated and thus (i) not all the automorphisms may have been generated and (ii) the returned labeling may not be canonical. The *terminate* function may be used to limit the time spent in bliss in case the graph is too difficult under the available time constraints. If used, keep the function simple to evaluate so that it does not consume too much time.

8.1.2.4 change_color()

```
virtual void bliss::AbstractGraph::change_color (
    const unsigned int vertex,
    const unsigned int color ) [pure virtual]
```

Change the color of the vertex *vertex* to *color*.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.5 find_automorphisms()

```
void bliss::AbstractGraph::find_automorphisms (
    Stats & stats,
    const std::function< void(unsigned int n, const unsigned int *aut)> & report =
nullptr,
    const std::function< bool()> & terminate = nullptr )
```

Find a set of generators for the automorphism group of the graph. The function *report* (if non-null) is called each time a new generator for the automorphism group is found. The first argument *n* for the function is the length of the automorphism (equal to [get_nof_vertices\(\)](#)), and the second argument *aut* is the automorphism (a bijection on $\{0, \dots, \text{get_nof_vertices}() - 1\}$). The memory for the automorphism *aut* will be invalidated immediately after the return from the *report* function; if you want to use the automorphism later, you have to take a copy of it. Do not call any member functions from the *report* function.

The search statistics are copied in *stats*.

If the *terminate* function argument is given, it is called in each search tree node: if the function returns true, then the search is terminated and thus not all the automorphisms may have been generated. The *terminate* function may be used to limit the time spent in bliss in case the graph is too difficult under the available time constraints. If used, keep the function simple to evaluate so that it does not consume too much time.

8.1.2.6 `get_color()`

```
virtual unsigned int bliss::AbstractGraph::get_color (
    const unsigned int vertex ) const [pure virtual]
```

Get the color of a vertex.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.7 `get_hash()`

```
virtual unsigned int bliss::AbstractGraph::get_hash ( ) [pure virtual]
```

Get a hash value for the graph.

Returns

the hash value

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.8 `get_nof_vertices()`

```
virtual unsigned int bliss::AbstractGraph::get_nof_vertices ( ) const [pure virtual]
```

Return the number of vertices in the graph.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.9 `is_automorphism()` [1/2]

```
virtual bool bliss::AbstractGraph::is_automorphism (
    const std::vector< unsigned int > & perm ) const [pure virtual]
```

Check whether *perm* is an automorphism of this graph. Unoptimized, mainly for debugging purposes.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.10 `is_automorphism()` [2/2]

```
virtual bool bliss::AbstractGraph::is_automorphism (
    unsigned int *const perm ) const [pure virtual]
```

Check whether *perm* is an automorphism of this graph. Unoptimized, mainly for debugging purposes.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.11 permute() [1/2]

```
virtual AbstractGraph * bliss::AbstractGraph::permute (
    const std::vector< unsigned int > & perm ) const [pure virtual]
```

Return a new graph that is the result of applying the permutation *perm* to this graph. This graph is not modified. *perm* must contain $N = \text{this.get_nof_vertices}()$ elements and be a bijection on $\{0, 1, \dots, N-1\}$, otherwise the result is undefined or a segfault.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.12 permute() [2/2]

```
virtual AbstractGraph * bliss::AbstractGraph::permute (
    const unsigned int *const perm ) const [pure virtual]
```

Return a new graph that is the result of applying the permutation *perm* to this graph. This graph is not modified. *perm* must contain $N = \text{this.get_nof_vertices}()$ elements and be a bijection on $\{0, 1, \dots, N-1\}$, otherwise the result is undefined or a segfault.

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.13 set_component_recursion()

```
void bliss::AbstractGraph::set_component_recursion (
    const bool active ) [inline]
```

Activate/deactivate component recursion. The choice affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same choice for both graphs. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate component recursion, deactivate otherwise
---------------	---

8.1.2.14 set_failure_recording()

```
void bliss::AbstractGraph::set_failure_recording (
    const bool active ) [inline]
```

Activate/deactivate failure recording. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate failure recording, deactivate otherwise
---------------	---

8.1.2.15 set_long_prune_activity()

```
void bliss::AbstractGraph::set_long_prune_activity (
    const bool active ) [inline]
```

Disable/enable the "long prune" method. The choice affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same choice for both graphs. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate "long prune", deactivate otherwise
---------------	--

8.1.2.16 set_verbose_file()

```
void bliss::AbstractGraph::set_verbose_file (
    FILE *const fp )
```

Set the file stream for the verbose output.

Parameters

<i>fp</i>	the file stream; if null, no verbose output is written
-----------	--

8.1.2.17 set_verbose_level()

```
void bliss::AbstractGraph::set_verbose_level (
    const unsigned int level )
```

Set the verbose output level for the algorithms.

Parameters

<i>level</i>	the level of verbose output, 0 means no verbose output
--------------	--

8.1.2.18 write_dimacs()

```
virtual void bliss::AbstractGraph::write_dimacs (
    FILE *const fp ) [pure virtual]
```

Write the graph to a file in a variant of the DIMACS format. See the [bliss website](#) for the definition of the file format. Note that in the DIMACS file the vertices are numbered from 1 to N while in this C++ API they are from 0 to N-1. Thus the vertex n in the file corresponds to the vertex n-1 in the API.

Parameters

<i>fp</i>	the file stream where the graph is written
-----------	--

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.19 write_dot() [1/2]

```
virtual void bliss::AbstractGraph::write_dot (
    const char *const file_name ) [pure virtual]
```

Write the graph in a file in the graphviz dotty format. Do nothing if the file cannot be written.

Parameters

<i>file_name</i>	the name of the file to which the graph is written
------------------	--

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

8.1.2.20 write_dot() [2/2]

```
virtual void bliss::AbstractGraph::write_dot (
    FILE *const fp ) [pure virtual]
```

Write the graph to a file in the graphviz dotty format.

Parameters

<i>fp</i>	the file stream where the graph is written
-----------	--

Implemented in [bliss::Digraph](#), and [bliss::Graph](#).

The documentation for this class was generated from the following files:

- `src/abstractgraph.hh`
- `src/abstractgraph.cc`

8.2 bliss::BigNum Class Reference

A simple wrapper class for non-negative big integers (or approximation of them).

```
#include <bignum.hh>
```

Public Member Functions

- [BigNum \(\)](#)
- [~BigNum \(\)](#)
- [void assign \(unsigned int n\)](#)
- [void multiply \(unsigned int n\)](#)
- [size_t print \(FILE *const fp\) const](#)
- [const std::vector< unsigned int > & get_factors \(\) const](#)
- [std::string to_string \(\) const](#)

8.2.1 Detailed Description

A simple wrapper class for non-negative big integers (or approximation of them).

If the compile time flag `BLISS_USE_GMP` is set, then the GNU Multiple Precision Arithmetic library (GMP) is used to obtain arbitrary precision. Otherwise, if the compile time flag `BLISS_BIGNUM_APPROX` is set, a "long double" is used to approximate a big integer. Otherwise, by default, a big integer is represented by a product of integer-sized factors.

8.2.2 Constructor & Destructor Documentation

8.2.2.1 `BigNum()`

```
bliss::BigNum::BigNum ( ) [inline]
```

Create a new big number and set it to zero.

8.2.2.2 `~BigNum()`

```
bliss::BigNum::~~BigNum ( ) [inline]
```

Destroy the number.

8.2.3 Member Function Documentation

8.2.3.1 `assign()`

```
void bliss::BigNum::assign (
    unsigned int n ) [inline]
```

Set the number to n .

8.2.3.2 `get_factors()`

```
const std::vector< unsigned int > & bliss::BigNum::get_factors ( ) const [inline]
```

Get a reference to the factors vector.

8.2.3.3 `multiply()`

```
void bliss::BigNum::multiply (
    unsigned int n ) [inline]
```

Multiply the number with n .

8.2.3.4 print()

```
size_t bliss::BigNum::print (
    FILE *const fp ) const [inline]
```

Print the number in the file stream *fp*. In the current version, the returned number of characters printed, is incorrect (either -1 or 0).

8.2.3.5 to_string()

```
std::string bliss::BigNum::to_string ( ) const [inline]
```

Get the string representation of the number. Unoptimized, uses an elementary school algorithm to multiply the factors.

The documentation for this class was generated from the following file:

- src/bignum.hh

8.3 bliss_graph_struct Struct Reference

The true bliss graph is hiding in this struct.

8.3.1 Detailed Description

The true bliss graph is hiding in this struct.

The documentation for this struct was generated from the following file:

- src/bliss_C.cc

8.4 bliss_stats_struct Struct Reference

The C API version of the statistics returned by the bliss search algorithm.

```
#include <bliss_C.h>
```

Public Attributes

- long double **group_size_approx**
An approximation (due to possible rounding errors) of the size of the automorphism group.
- long unsigned int **nof_nodes**
The number of nodes in the search tree.
- long unsigned int **nof_leaf_nodes**
The number of leaf nodes in the search tree.
- long unsigned int **nof_bad_nodes**
The number of bad nodes in the search tree.
- long unsigned int **nof_canupdates**
The number of canonical representative updates.
- long unsigned int **nof_generators**
The number of generator permutations.
- unsigned long int **max_level**
The maximal depth of the search tree.

8.4.1 Detailed Description

The C API version of the statistics returned by the bliss search algorithm.

The documentation for this struct was generated from the following file:

- [src/bliss_C.h](#)

8.5 bliss::Partition::Cell Class Reference

Data structure for holding information about a cell in a [Partition](#).

```
#include <partition.hh>
```

Public Member Functions

- [bool is_unit \(\) const](#)
- [bool is_in_splitting_queue \(\) const](#)

8.5.1 Detailed Description

Data structure for holding information about a cell in a [Partition](#).

8.5.2 Member Function Documentation

8.5.2.1 is_in_splitting_queue()

```
bool bliss::Partition::Cell::is_in_splitting_queue ( ) const [inline]
```

Is this cell in splitting queue?

8.5.2.2 is_unit()

```
bool bliss::Partition::Cell::is_unit ( ) const [inline]
```

Is this a unit cell?

The documentation for this class was generated from the following file:

- [src/partition.hh](#)

8.6 bliss::Digraph Class Reference

The class for directed, vertex colored graphs.

```
#include <digraph.hh>
```

Inheritance diagram for bliss::Digraph:

Classes

- class **Vertex**

Public Types

Static Public Member Functions

- `static Digraph * read_dimacs (FILE *const fp, FILE *const errstr=stderr)`

8.6.1 Detailed Description

The class for directed, vertex colored graphs.

Multiple edges between vertices are not allowed (copies will be ignored).

8.6.2 Member Enumeration Documentation

8.6.2.1 SplittingHeuristic

```
enum bliss::Digraph::SplittingHeuristic
```

The possible splitting heuristics. The selected splitting heuristics affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same splitting heuristics for both graphs.

Enumerator

<code>shs_f</code>	First non-unit cell. Very fast but may result in large search spaces on difficult graphs. Use for large but easy graphs.
<code>shs_fs</code>	First smallest non-unit cell. Fast, should usually produce smaller search spaces than <code>shs_f</code> .
<code>shs_fl</code>	First largest non-unit cell. Fast, should usually produce smaller search spaces than <code>shs_f</code> .
<code>shs_fm</code>	First maximally non-trivially connected non-unit cell. Not so fast, should usually produce smaller search spaces than <code>shs_f</code> , <code>shs_fs</code> , and <code>shs_fl</code> .
<code>shs_fsm</code>	First smallest maximally non-trivially connected non-unit cell. Not so fast, should usually produce smaller search spaces than <code>shs_f</code> , <code>shs_fs</code> , and <code>shs_fl</code> .
<code>shs_flm</code>	First largest maximally non-trivially connected non-unit cell. Not so fast, should usually produce smaller search spaces than <code>shs_f</code> , <code>shs_fs</code> , and <code>shs_fl</code> .

8.6.3 Constructor & Destructor Documentation

8.6.3.1 Digraph()

```
bliss::Digraph::Digraph (
```

```
const unsigned int N = 0 )
```

Create a new directed graph with N vertices and no edges.

8.6.3.2 ~Digraph()

```
bliss::Digraph::~~Digraph ( )
```

Destroy the graph.

8.6.4 Member Function Documentation

8.6.4.1 add_edge()

```
void bliss::Digraph::add_edge (
    const unsigned int source,
    const unsigned int target ) [virtual]
```

Add an edge from the vertex *source* to the vertex *target*. Duplicate edges are ignored but try to avoid introducing them in the first place as they are not ignored immediately but will consume memory and computation resources for a while.

Implements [bliss::AbstractGraph](#).

8.6.4.2 add_vertex()

```
unsigned int bliss::Digraph::add_vertex (
    const unsigned int color = 0 ) [virtual]
```

Add a new vertex with color 'color' in the graph and return its index.

Implements [bliss::AbstractGraph](#).

8.6.4.3 canonical_form()

```
const unsigned int * bliss::AbstractGraph::canonical_form (
    Stats & stats,
    const std::function< void(unsigned int n, const unsigned int *aut)> & report =
    nullptr,
    const std::function< bool()> & terminate = nullptr ) [inherited]
```

Otherwise the same as [find_automorphisms\(\)](#) except that a canonical labeling of the graph (a bijection on $\{0, \dots, \text{get_nof_vertices}()-1\}$) is returned. The memory allocated for the returned canonical labeling will remain valid only until the next call to a member function with the exception that constant member functions (for example, [bliss::Graph::permute\(\)](#)) can be called without invalidating the labeling. To compute the canonical version of an undirected graph, call this function and then [bliss::Graph::permute\(\)](#) with the returned canonical labeling. Note that the computed canonical version may depend on the applied version of bliss as well as on some other options (for instance, the splitting heuristic selected with [bliss::Graph::set_splitting_heuristic\(\)](#)).

If the *terminate* function argument is given, it is called in each search tree node: if the function returns true, then the search is terminated and thus (i) not all the automorphisms may have been generated and (ii) the returned labeling may not be canonical. The *terminate* function may be used to limit the time spent in bliss in case the graph is too difficult under the available time constraints. If used, keep the function simple to evaluate so that it does not consume too much time.

8.6.4.4 change_color()

```
void bliss::Digraph::change_color (
    const unsigned int vertex,
    const unsigned int color ) [virtual]
```

Change the color of the vertex 'vertex' to 'color'.

Implements [bliss::AbstractGraph](#).

8.6.4.5 cmp()

```
int bliss::Digraph::cmp (
    Digraph & other )
```

Compare this graph to the *other* graph in a total order on graphs.

Returns

0 if the graphs are equal, -1 if this graph is "smaller than" the other, and 1 if this graph is "greater than" the other.

8.6.4.6 copy()

```
Digraph * bliss::Digraph::copy ( ) const
```

Get a copy of the graph.

8.6.4.7 find_automorphisms()

```
void bliss::AbstractGraph::find_automorphisms (
    Stats & stats,
    const std::function< void(unsigned int n, const unsigned int *aut)> & report =
    nullptr,
    const std::function< bool()> & terminate = nullptr ) [inherited]
```

Find a set of generators for the automorphism group of the graph. The function *report* (if non-null) is called each time a new generator for the automorphism group is found. The first argument *n* for the function is the length of the automorphism (equal to [get_nof_vertices\(\)](#)), and the second argument *aut* is the automorphism (a bijection on {0,...,[get_nof_vertices\(\)](#)-1}). The memory for the automorphism *aut* will be invalidated immediately after the return from the *report* function; if you want to use the automorphism later, you have to take a copy of it. Do not call any member functions from the *report* function.

The search statistics are copied in *stats*.

If the *terminate* function argument is given, it is called in each search tree node: if the function returns true, then the search is terminated and thus not all the automorphisms may have been generated. The *terminate* function may be used to limit the time spent in bliss in case the graph is too difficult under the available time constraints. If used, keep the function simple to evaluate so that it does not consume too much time.

8.6.4.8 get_color()

```
unsigned int bliss::Digraph::get_color (
    const unsigned int vertex ) const [virtual]
```

Get the color of a vertex.

Implements [bliss::AbstractGraph](#).

8.6.4.9 get_hash()

```
unsigned int bliss::Digraph::get_hash ( ) [virtual]
```

Get a hash value for the graph.

Returns

the hash value

Implements [bliss::AbstractGraph](#).

8.6.4.10 get_nof_vertices()

```
unsigned int bliss::Digraph::get_nof_vertices ( ) const [inline], [virtual]
```

Return the number of vertices in the graph.

Implements [bliss::AbstractGraph](#).

8.6.4.11 is_automorphism() [1/2]

```
bool bliss::Digraph::is_automorphism (
    const std::vector< unsigned int > & perm ) const [virtual]
```

Check whether *perm* is an automorphism of this graph. Unoptimized, mainly for debugging purposes.

Implements [bliss::AbstractGraph](#).

8.6.4.12 is_automorphism() [2/2]

```
bool bliss::Digraph::is_automorphism (
    unsigned int *const perm ) const [virtual]
```

Check whether *perm* is an automorphism of this graph. Unoptimized, mainly for debugging purposes.

Implements [bliss::AbstractGraph](#).

8.6.4.13 permute() [1/2]

```
Digraph * bliss::Digraph::permute (
    const std::vector< unsigned int > & perm ) const [virtual]
```

Return a new graph that is the result of applying the permutation *perm* to this graph. This graph is not modified. *perm* must contain $N = \text{this.get_nof_vertices}()$ elements and be a bijection on $\{0, 1, \dots, N-1\}$, otherwise the result is undefined or a segfault.

Implements [bliss::AbstractGraph](#).

8.6.4.14 permute() [2/2]

```
Digraph * bliss::Digraph::permute (
    const unsigned int *const perm ) const [virtual]
```

Return a new graph that is the result of applying the permutation *perm* to this graph. This graph is not modified. *perm* must contain $N = \text{this.get_nof_vertices}()$ elements and be a bijection on $\{0, 1, \dots, N-1\}$, otherwise the result is undefined or a segfault.

Implements [bliss::AbstractGraph](#).

8.6.4.15 read_dimacs()

```
Digraph * bliss::Digraph::read_dimacs (
    FILE *const fp,
    FILE *const errstr = stderr ) [static]
```

Read the graph from the file *fp* in a variant of the DIMACS format. See the [bliss website](#) for the definition of the file format. Note that in the DIMACS file the vertices are numbered from 1 to N while in this C++ API they are from 0 to $N-1$. Thus the vertex n in the file corresponds to the vertex $n-1$ in the API.

Parameters

<i>fp</i>	the file stream for the graph file
<i>errstr</i>	if non-null, the possible error messages are printed in this file stream

Returns

a new [Digraph](#) object or 0 if reading failed for some reason

8.6.4.16 set_component_recursion()

```
void bliss::AbstractGraph::set_component_recursion (
    const bool active ) [inline], [inherited]
```

Activate/deactivate component recursion. The choice affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same choice for both graphs. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate component recursion, deactivate otherwise
---------------	---

8.6.4.17 set_failure_recording()

```
void bliss::AbstractGraph::set_failure_recording (
    const bool active ) [inline], [inherited]
```

Activate/deactivate failure recording. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate failure recording, deactivate otherwise
---------------	---

8.6.4.18 set_long_prune_activity()

```
void bliss::AbstractGraph::set_long_prune_activity (
    const bool active ) [inline], [inherited]
```

Disable/enable the "long prune" method. The choice affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same choice for both graphs. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate "long prune", deactivate otherwise
---------------	--

8.6.4.19 set_splitting_heuristic()

```
void bliss::Digraph::set_splitting_heuristic (
    SplittingHeuristic shs ) [inline]
```

Set the splitting heuristic used by the automorphism and canonical labeling algorithm. The selected splitting heuristics affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same splitting heuristics for both graphs.

8.6.4.20 set_verbose_file()

```
void bliss::AbstractGraph::set_verbose_file (
    FILE *const fp ) [inherited]
```

Set the file stream for the verbose output.

Parameters

<i>fp</i>	the file stream; if null, no verbose output is written
-----------	--

8.6.4.21 set_verbose_level()

```
void bliss::AbstractGraph::set_verbose_level (
    const unsigned int level ) [inherited]
```

Set the verbose output level for the algorithms.

Parameters

<i>level</i>	the level of verbose output, 0 means no verbose output
--------------	--

8.6.4.22 write_dimacs()

```
void bliss::Digraph::write_dimacs (
    FILE *const fp ) [virtual]
```

Write the graph to a file in a variant of the DIMACS format. See the [bliss website](#) for the definition of the file format. Note that in the DIMACS file the vertices are numbered from 1 to N while in this C++ API they are from 0 to N-1. Thus the vertex n in the file corresponds to the vertex n-1 in the API.

Parameters

<i>fp</i>	the file stream where the graph is written
-----------	--

Implements [bliss::AbstractGraph](#).

8.6.4.23 write_dot() [1/2]

```
void bliss::Digraph::write_dot (
    const char *const file_name ) [virtual]
```

Write the graph in a file in the graphviz doty format. Do nothing if the file cannot be written.

Parameters

<i>file_name</i>	the name of the file to which the graph is written
------------------	--

Implements [bliss::AbstractGraph](#).

8.6.4.24 write_dot() [2/2]

```
void bliss::Digraph::write_dot (
    FILE *const fp ) [virtual]
```

Write the graph to a file in the graphviz dotty format.

Parameters

<i>fp</i>	the file stream where the graph is written
-----------	--

Implements [bliss::AbstractGraph](#).

The documentation for this class was generated from the following files:

8.7.1 Detailed Description

The class for undirected, vertex colored graphs.

Multiple edges between vertices are not allowed (i.e., are ignored).

8.7.2 Member Enumeration Documentation

8.7.2.1 SplittingHeuristic

```
enum bliss::Graph::SplittingHeuristic
```

The possible splitting heuristics. The selected splitting heuristics affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same splitting heuristics for both graphs.

Enumerator

shs_f	First non-unit cell. Very fast but may result in large search spaces on difficult graphs. Use for large but easy graphs.
shs_fs	First smallest non-unit cell. Fast, should usually produce smaller search spaces than shs_f.
shs_fl	First largest non-unit cell. Fast, should usually produce smaller search spaces than shs_f.
shs_fm	First maximally non-trivially connected non-unit cell. Not so fast, should usually produce smaller search spaces than shs_f, shs_fs, and shs_fl.
shs_fsm	First smallest maximally non-trivially connected non-unit cell. Not so fast, should usually produce smaller search spaces than shs_f, shs_fs, and shs_fl.
shs_flm	First largest maximally non-trivially connected non-unit cell. Not so fast, should usually produce smaller search spaces than shs_f, shs_fs, and shs_fl.

8.7.3 Constructor & Destructor Documentation

8.7.3.1 Graph()

```
bliss::Graph::Graph (
    const unsigned int N = 0 )
```

Create a new graph with N vertices and no edges.

8.7.3.2 ~Graph()

```
bliss::Graph::~~Graph ( )
```

Destroy the graph.

8.7.4 Member Function Documentation

8.7.4.1 add_edge()

```
void bliss::Graph::add_edge (
    const unsigned int v1,
    const unsigned int v2 ) [virtual]
```

Add an edge between vertices $v1$ and $v2$. Duplicate edges between vertices are ignored but try to avoid introducing them in the first place as they are not ignored immediately but will consume memory and computation resources for a while.

Implements [bliss::AbstractGraph](#).

8.7.4.2 add_vertex()

```
unsigned int bliss::Graph::add_vertex (
    const unsigned int color = 0 ) [virtual]
```

Add a new vertex with color $color$ in the graph and return its index.

Implements [bliss::AbstractGraph](#).

8.7.4.3 canonical_form()

```
const unsigned int * bliss::AbstractGraph::canonical_form (
    Stats & stats,
    const std::function< void(unsigned int n, const unsigned int *aut)> & report =
    nullptr,
    const std::function< bool()> & terminate = nullptr ) [inherited]
```

Otherwise the same as [find_automorphisms\(\)](#) except that a canonical labeling of the graph (a bijection on $\{0, \dots, \text{get_nof_vertices}() - 1\}$) is returned. The memory allocated for the returned canonical labeling will remain valid only until the next call to a member function with the exception that constant member functions (for example, [bliss::Graph::permute\(\)](#)) can be called without invalidating the labeling. To compute the canonical version of an undirected graph, call this function and then [bliss::Graph::permute\(\)](#) with the returned canonical labeling. Note that the computed canonical version may depend on the applied version of bliss as well as on some other options (for instance, the splitting heuristic selected with [bliss::Graph::set_splitting_heuristic\(\)](#)).

If the *terminate* function argument is given, it is called in each search tree node: if the function returns true, then the search is terminated and thus (i) not all the automorphisms may have been generated and (ii) the returned labeling may not be canonical. The *terminate* function may be used to limit the time spent in bliss in case the graph is too difficult under the available time constraints. If used, keep the function simple to evaluate so that it does not consume too much time.

8.7.4.4 change_color()

```
void bliss::Graph::change_color (
    const unsigned int vertex,
    const unsigned int color ) [virtual]
```

Change the color of the vertex *vertex* to *color*.

Implements [bliss::AbstractGraph](#).

8.7.4.5 cmp()

```
int bliss::Graph::cmp (
    Graph & other )
```

Compare this graph to the *other* graph in a total order on graphs.

Returns

0 if the graphs are equal, -1 if this graph is "smaller than" the other, and 1 if this graph is "greater than" the other.

8.7.4.6 copy()

```
Graph * bliss::Graph::copy ( ) const
```

Get a copy of the graph.

8.7.4.7 find_automorphisms()

```
void bliss::AbstractGraph::find_automorphisms (
    Stats & stats,
    const std::function< void(unsigned int n, const unsigned int *aut)> & report =
nullptr,
    const std::function< bool()> & terminate = nullptr ) [inherited]
```

Find a set of generators for the automorphism group of the graph. The function *report* (if non-null) is called each time a new generator for the automorphism group is found. The first argument *n* for the function is the length of the automorphism (equal to [get_nof_vertices\(\)](#)), and the second argument *aut* is the automorphism (a bijection on {0,...[get_nof_vertices\(\)](#)-1}). The memory for the automorphism *aut* will be invalidated immediately after the return from the *report* function; if you want to use the automorphism later, you have to take a copy of it. Do not call any member functions from the *report* function.

The search statistics are copied in *stats*.

If the *terminate* function argument is given, it is called in each search tree node: if the function returns true, then the search is terminated and thus not all the automorphisms may have been generated. The *terminate* function may be used to limit the time spent in bliss in case the graph is too difficult under the available time constraints. If used, keep the function simple to evaluate so that it does not consume too much time.

8.7.4.8 get_color()

```
unsigned int bliss::Graph::get_color (
    const unsigned int vertex ) const [virtual]
```

Get the color of a vertex.

Implements [bliss::AbstractGraph](#).

8.7.4.9 get_hash()

```
unsigned int bliss::Graph::get_hash ( ) [virtual]
```

Get a hash value for the graph.

Returns

the hash value

Implements [bliss::AbstractGraph](#).

8.7.4.10 get_nof_vertices()

```
unsigned int bliss::Graph::get_nof_vertices ( ) const [inline], [virtual]
```

Return the number of vertices in the graph.

Implements [bliss::AbstractGraph](#).

8.7.4.11 is_automorphism() [1/2]

```
bool bliss::Graph::is_automorphism (
    const std::vector< unsigned int > & perm ) const [virtual]
```

Check whether *perm* is an automorphism of this graph. Unoptimized, mainly for debugging purposes.

Implements [bliss::AbstractGraph](#).

8.7.4.12 is_automorphism() [2/2]

```
bool bliss::Graph::is_automorphism (
    unsigned int *const perm ) const [virtual]
```

Check whether *perm* is an automorphism of this graph. Unoptimized, mainly for debugging purposes.

Implements [bliss::AbstractGraph](#).

8.7.4.13 permute() [1/2]

```
Graph * bliss::Graph::permute (
    const std::vector< unsigned int > & perm ) const [virtual]
```

Return a new graph that is the result of applying the permutation *perm* to this graph. This graph is not modified. *perm* must contain $N = \text{this.get_nof_vertices}()$ elements and be a bijection on $\{0, 1, \dots, N-1\}$, otherwise the result is undefined or a segfault.

Implements [bliss::AbstractGraph](#).

8.7.4.14 permute() [2/2]

```
Graph * bliss::Graph::permute (
    const unsigned int *const perm ) const [virtual]
```

Return a new graph that is the result of applying the permutation *perm* to this graph. This graph is not modified. *perm* must contain $N = \text{this.get_nof_vertices}()$ elements and be a bijection on $\{0, 1, \dots, N-1\}$, otherwise the result is undefined or a segfault.

Implements [bliss::AbstractGraph](#).

8.7.4.15 read_dimacs()

```
Graph * bliss::Graph::read_dimacs (
    FILE *const fp,
    FILE *const errstr = stderr ) [static]
```

Read the graph from the file *fp* in a variant of the DIMACS format. See the [bliss website](#) for the definition of the file format. Note that in the DIMACS file the vertices are numbered from 1 to N while in this C++ API they are from 0 to $N-1$. Thus the vertex n in the file corresponds to the vertex $n-1$ in the API.

Parameters

<i>fp</i>	the file stream for the graph file
<i>errstr</i>	if non-null, the possible error messages are printed in this file stream

Returns

a new [Graph](#) object or 0 if reading failed for some reason

8.7.4.16 set_component_recursion()

```
void bliss::AbstractGraph::set_component_recursion (
    const bool active ) [inline], [inherited]
```

Activate/deactivate component recursion. The choice affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same choice for both graphs. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate component recursion, deactivate otherwise
---------------	---

8.7.4.17 set_failure_recording()

```
void bliss::AbstractGraph::set_failure_recording (
    const bool active ) [inline], [inherited]
```

Activate/deactivate failure recording. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate failure recording, deactivate otherwise
---------------	---

8.7.4.18 set_long_prune_activity()

```
void bliss::AbstractGraph::set_long_prune_activity (
    const bool active ) [inline], [inherited]
```

Disable/enable the "long prune" method. The choice affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same choice for both graphs. May not be called during the search, i.e. from an automorphism reporting hook function.

Parameters

<i>active</i>	if true, activate "long prune", deactivate otherwise
---------------	--

8.7.4.19 `set_splitting_heuristic()`

```
void bliss::Graph::set_splitting_heuristic (
    const SplittingHeuristic shs ) [inline]
```

Set the splitting heuristic used by the automorphism and canonical labeling algorithm. The selected splitting heuristics affects the computed canonical labelings; therefore, if you want to compare whether two graphs are isomorphic by computing and comparing (for equality) their canonical versions, be sure to use the same splitting heuristics for both graphs.

8.7.4.20 `set_verbose_file()`

```
void bliss::AbstractGraph::set_verbose_file (
    FILE *const fp ) [inherited]
```

Set the file stream for the verbose output.

Parameters

<i>fp</i>	the file stream; if null, no verbose output is written
-----------	--

8.7.4.21 `set_verbose_level()`

```
void bliss::AbstractGraph::set_verbose_level (
    const unsigned int level ) [inherited]
```

Set the verbose output level for the algorithms.

Parameters

<i>level</i>	the level of verbose output, 0 means no verbose output
--------------	--

8.7.4.22 `write_dimacs()`

```
void bliss::Graph::write_dimacs (
    FILE *const fp ) [virtual]
```

Write the graph to a file in a variant of the DIMACS format. See the [bliss website](#) for the definition of the file format.

Implements [bliss::AbstractGraph](#).

8.7.4.23 `write_dot()` [1/2]

```
void bliss::Graph::write_dot (
    const char *const file_name ) [virtual]
```

Write the graph in a file in the graphviz dotty format. Do nothing if the file cannot be written.

Parameters

<i>file_name</i>	the name of the file to which the graph is written
------------------	--

Implements [bliss::AbstractGraph](#).

8.7.4.24 write_dot() [2/2]

```
void bliss::Graph::write_dot (
    FILE *const fp ) [virtual]
```

Write the graph to a file in the graphviz dotty format.

Parameters

<i>fp</i>	the file stream where the graph is written
-----------	--

Implements [bliss::AbstractGraph](#).

The documentation for this class was generated from the following files:

- src/graph.hh
- src/graph.cc

8.8 bliss::Heap Class Reference

A min-heap of unsigned integers.

```
#include <heap.hh>
```

Public Member Functions

- [bool is_empty \(\) const](#)
- [void clear \(\)](#)
- [void insert \(const unsigned int e\)](#)
- [unsigned int smallest \(\) const](#)
- [unsigned int remove \(\)](#)
- [size_t size \(\) const](#)

8.8.1 Detailed Description

A min-heap of unsigned integers.

8.8.2 Member Function Documentation

8.8.2.1 clear()

```
void bliss::Heap::clear ( ) [inline]
```

Remove all the elements in the heap. Time complexity is $O(1)$.

8.8.2.2 insert()

```
void bliss::Heap::insert (
    const unsigned int e ) [inline]
```

Insert the element e in the heap. Time complexity is $O(\log(N))$, where N is the number of elements currently in the heap.

8.8.2.3 is_empty()

```
bool bliss::Heap::is_empty ( ) const [inline]
```

Is the heap empty? Time complexity is $O(1)$.

8.8.2.4 remove()

```
unsigned int bliss::Heap::remove ( ) [inline]
```

Remove and return the smallest element in the heap. Time complexity is $O(\log(N))$, where N is the number of elements currently in the heap.

8.8.2.5 size()

```
size_t bliss::Heap::size ( ) const [inline]
```

Get the number of elements in the heap.

8.8.2.6 smallest()

```
unsigned int bliss::Heap::smallest ( ) const [inline]
```

Return the smallest element in the heap. Time complexity is $O(1)$.

The documentation for this class was generated from the following file:

- src/heap.hh

8.9 bliss::KQueue< Type > Class Template Reference

A simple implementation of queues with fixed maximum capacity.

```
#include <kqueue.hh>
```

Public Member Functions

- [KQueue](#) ()
- [void init](#) (const unsigned int N)

- [void push_back](#) (Type e)

8.9.1 Detailed Description

```
template<class Type>  
class bliss::KQueue< Type >
```

A simple implementation of queues with fixed maximum capacity.

8.9.2 Constructor & Destructor Documentation

8.9.2.1 KQueue()

```
template<class Type >  
bliss::KQueue< Type >::KQueue ( )
```

Create a new queue with capacity zero. The function [init\(\)](#) should be called next.

8.9.3 Member Function Documentation

8.9.3.1 clear()

```
template<class Type >  
void bliss::KQueue< Type >::clear ( )
```

Remove all the elements in the queue.

8.9.3.2 front()

```
template<class Type >
Type bliss::KQueue< Type >::front ( ) const
```

Return (but don't remove) the first element in the queue.

8.9.3.3 init()

```
template<class Type >
void bliss::KQueue< Type >::init (
    const unsigned int N )
```

Initialize the queue to have the capacity to hold at most N elements.

8.9.3.4 is_empty()

```
template<class Type >
bool bliss::KQueue< Type >::is_empty ( ) const
```

Is the queue empty?

8.9.3.5 pop_back()

```
template<class Type >
Type bliss::KQueue< Type >::pop_back ( )
```

Remove and return the last element of the queue.

8.9.3.6 pop_front()

```
template<class Type >
Type bliss::KQueue< Type >::pop_front ( )
```

Remove and return the first element of the queue.

8.9.3.7 push_back()

```
template<class Type >
void bliss::KQueue< Type >::push_back (
    Type e )
```

Push the element e in the back of the queue.

8.9.3.8 push_front()

```
template<class Type >
void bliss::KQueue< Type >::push_front (
    Type e )
```

Push the element *e* in the front of the queue.

8.9.3.9 size()

```
template<class Type >
unsigned int bliss::KQueue< Type >::size ( ) const
```

Return the number of elements in the queue.

The documentation for this class was generated from the following file:

- src/kqueue.hh

8.10 bliss::Orbit Class Reference

A class for representing orbit information.

```
#include <orbit.hh>
```

Public Member Functions

- [Orbit](#) ()
- [void init](#) (const unsigned int N)
- [void reset](#) ()
- [void merge_orbits](#) (unsigned int e1, unsigned int e2)
- [bool is_minimal_representative](#) (unsigned int e) const
- [unsigned int get_minimal_representative](#) (unsigned int e) const
- [unsigned int orbit_size](#) (unsigned int e) const
- [unsigned int nof_orbits](#) () const

8.10.1 Detailed Description

A class for representing orbit information.

Given a set {0,...,N-1} of N elements, represent equivalence classes (that is, unordered partitions) of the elements. Supports only equivalence class merging, not splitting. Merging two classes requires time $O(k)$, where k is the number of the elements in the smaller of the merged classes. Getting the smallest representative in a class (and thus testing whether two elements belong to the same class) is a constant time operation.

8.10.2 Constructor & Destructor Documentation

8.10.2.1 Orbit()

```
bliss::Orbit::Orbit ( )
```

Create a new orbit information object. The [init\(\)](#) function must be called next to actually initialize the object.

8.10.3 Member Function Documentation

8.10.3.1 get_minimal_representative()

```
unsigned int bliss::Orbit::get_minimal_representative (
    unsigned int e ) const
```

Get the smallest element in the orbit of the element e . Time complexity is $O(1)$.

8.10.3.2 init()

```
void bliss::Orbit::init (
    const unsigned int N )
```

Initialize the orbit information to consider sets of N elements. It is required that $N > 0$. The orbit information is reset so that each element forms an orbit of its own. Time complexity is $O(N)$.

See also

[reset\(\)](#)

8.10.3.3 is_minimal_representative()

```
bool bliss::Orbit::is_minimal_representative (
    unsigned int e ) const
```

Is the element e the smallest element in its orbit? Time complexity is $O(1)$.

8.10.3.4 merge_orbits()

```
void bliss::Orbit::merge_orbits (
    unsigned int e1,
    unsigned int e2 )
```

Merge the orbits of the elements $e1$ and $e2$. Time complexity is $O(k)$, where k is the number of elements in the smaller of the merged orbits.

8.10.3.5 nof_orbits()

```
unsigned int bliss::Orbit::nof_orbits ( ) const [inline]
```

Get the number of orbits. Time complexity is $O(1)$.

8.10.3.6 orbit_size()

```
unsigned int bliss::Orbit::orbit_size (
    unsigned int e ) const
```

Get the number of elements in the orbit of the element *e*. Time complexity is $O(1)$.

8.10.3.7 reset()

```
void bliss::Orbit::reset ( )
```

Reset the orbits so that each element forms an orbit of its own. Time complexity is $O(N)$.

The documentation for this class was generated from the following files:

- src/orbit.hh
- src/orbit.cc

8.11 bliss::Partition Class Reference

A class for refinable, backtrackable ordered partitions.

```
#include <partition.hh>
```

Classes

- class [Cell](#)
Data structure for holding information about a cell in a [Partition](#).

Public Types

- `typedef unsigned int BacktrackPoint`

Public Member Functions

- `BacktrackPoint set_backtrack_point ()`
- `void goto_backtrack_point (BacktrackPoint p)`
- `Cell * individualize (Cell *const cell, const unsigned int element)`
- `Cell * get_cell (const unsigned int e) const`
- `void init (const unsigned int N)`
- `bool is_discrete () const`
- `size_t print (FILE *const fp, const bool add_newline=true) const`
- `size_t print_signature (FILE *const fp, const bool add_newline=true) const`
- `void clear_ivs (Cell *const cell)`

8.11.1 Detailed Description

A class for refinable, backtrackable ordered partitions.

This is rather a data structure with some helper functions than a proper self-contained class. That is, for efficiency reasons the fields of this class are directly manipulated from [bliss::AbstractGraph](#) and its subclasses. Conversely, some methods of this class modify the fields of [bliss::AbstractGraph](#), too.

8.11.2 Member Typedef Documentation

8.11.2.1 BacktrackPoint

```
typedef unsigned int bliss::Partition::BacktrackPoint
```

Type for backtracking points.

8.11.3 Member Function Documentation

8.11.3.1 clear_ivs()

```
void bliss::Partition::clear_ivs (
    Cell *const cell )
```

Clear the invariant_values of the elements in the [Cell](#) *cell*.

8.11.3.2 get_cell()

```
Cell * bliss::Partition::get_cell (
    const unsigned int e ) const [inline]
```

Get the cell of the element *e*

8.11.3.3 goto_backtrack_point()

```
void bliss::Partition::goto_backtrack_point (
    BacktrackPoint p )
```

Backtrack to the point *p* and remove it.

8.11.3.4 individualize()

```
Partition::Cell * bliss::Partition::individualize (
    Partition::Cell *const cell,
    const unsigned int element )
```

Split the non-unit [Cell](#) *cell* = {*element*,*e1*,*e2*,...,*en*} containing the element *element* in two: *cell* = {*e1*,...,*en*} and *newcell* = {*element*}.

Parameters

<i>cell</i>	a non-unit Cell
<i>element</i>	an element in <i>cell</i>

Returns

the new unit [Cell](#) *newcell*

8.11.3.5 init()

```
void bliss::Partition::init (
    const unsigned int N )
```

Initialize the partition to the unit partition (all elements in one cell) over the $N > 0$ elements $\{0, \dots, N-1\}$.

8.11.3.6 is_discrete()

```
bool bliss::Partition::is_discrete ( ) const [inline]
```

Returns true iff the partition is discrete, meaning that all the elements are in their own cells.

8.11.3.7 print()

```
size_t bliss::Partition::print (
    FILE *const fp,
    const bool add_newline = true ) const
```

Print the partition into the file stream *fp*.

8.11.3.8 print_signature()

```
size_t bliss::Partition::print_signature (
    FILE *const fp,
    const bool add_newline = true ) const
```

Print the partition cell sizes into the file stream *fp*.

8.11.3.9 set_backtrack_point()

```
Partition::BacktrackPoint bliss::Partition::set_backtrack_point ( )
```

Get a new backtrack point for the current partition

The documentation for this class was generated from the following files:

- src/partition.hh
- src/partition.cc

8.12 bliss::Stats Class Reference

Statistics returned by the bliss search algorithm.

```
#include <stats.hh>
```

Public Member Functions

- [size_t print \(FILE *const fp\) const](#)
- [const BigNum & get_group_size \(\) const](#)
- [long double get_group_size_approx \(\) const](#)
- [long unsigned int get_nof_nodes \(\) const](#)
- [long unsigned int get_nof_leaf_nodes \(\) const](#)
- [long unsigned int get_nof_bad_nodes \(\) const](#)
- [long unsigned int get_nof_canupdates \(\) const](#)
- [long unsigned int get_nof_generators \(\) const](#)
- [unsigned long int get_max_level \(\) const](#)

8.12.1 Detailed Description

Statistics returned by the bliss search algorithm.

8.12.2 Member Function Documentation

8.12.2.1 get_group_size()

```
const BigNum & bliss::Stats::get_group_size ( ) const [inline]
```

The size of the automorphism group.

8.12.2.2 get_group_size_approx()

```
long double bliss::Stats::get_group_size_approx ( ) const [inline]
```

An approximation (due to possible overflows/rounding errors) of the size of the automorphism group.

8.12.2.3 get_max_level()

```
unsigned long int bliss::Stats::get_max_level ( ) const [inline]
```

The maximal depth of the search tree.

8.12.2.4 get_nof_bad_nodes()

```
long unsigned int bliss::Stats::get_nof_bad_nodes ( ) const [inline]
```

The number of bad nodes in the search tree.

8.12.2.5 get_nof_canupdates()

```
long unsigned int bliss::Stats::get_nof_canupdates ( ) const [inline]
```

The number of canonical representative updates.

8.12.2.6 get_nof_generators()

```
long unsigned int bliss::Stats::get_nof_generators ( ) const [inline]
```

The number of generator permutations.

8.12.2.7 get_nof_leaf_nodes()

```
long unsigned int bliss::Stats::get_nof_leaf_nodes ( ) const [inline]
```

The number of leaf nodes in the search tree.

8.12.2.8 get_nof_nodes()

```
long unsigned int bliss::Stats::get_nof_nodes ( ) const [inline]
```

The number of nodes in the search tree.

8.12.2.9 print()

```
size_t bliss::Stats::print (
    FILE *const fp ) const [inline]
```

Print the statistics.

The documentation for this class was generated from the following file:

- src/stats.hh

8.13 bliss::Timer Class Reference

A simple helper class for measuring elapsed time.

```
#include <timer.hh>
```

Public Member Functions

- **Timer** ()
Create and start a new timer.
- **void reset** ()
Reset the timer.
- **double get_duration** () **const**
Get the time (in seconds) elapsed since the creation or the last [reset\(\)](#) call of the timer.

8.13.1 Detailed Description

A simple helper class for measuring elapsed time.

The documentation for this class was generated from the following file:

- src/timer.hh

8.14 bliss::UIntSeqHash Class Reference

A updatable hash for sequences of unsigned ints.

```
#include <uintseqhash.hh>
```

Public Member Functions

- [void reset \(\)](#)
- [void update \(unsigned int n\)](#)
- [unsigned int get_value \(\) const](#)
- [int cmp \(const UIntSeqHash &other\) const](#)
- [bool is_lt \(const UIntSeqHash &other\) const](#)
- [bool is_le \(const UIntSeqHash &other\) const](#)
- [bool is_equal \(const UIntSeqHash &other\) const](#)

8.14.1 Detailed Description

A updatable hash for sequences of unsigned ints.

8.14.2 Member Function Documentation

8.14.2.1 cmp()

```
int bliss::UIntSeqHash::cmp (
    const UIntSeqHash & other ) const [inline]
```

Compare the hash values of this and *other*. Return -1/0/1 if the value of this is smaller/equal/greater than that of *other*.

8.14.2.2 get_value()

```
unsigned int bliss::UIntSeqHash::get_value ( ) const [inline]
```

Get the hash value of the sequence seen so far.

8.14.2.3 is_equal()

```
bool bliss::UIntSeqHash::is_equal (
    const UIntSeqHash & other ) const [inline]
```

An abbreviation for `cmp(other) == 0`

8.14.2.4 is_le()

```
bool bliss::UIntSeqHash::is_le (
    const UIntSeqHash & other ) const [inline]
```

An abbreviation for `cmp(other) <= 0`

8.14.2.5 is_lt()

```
bool bliss::UIntSeqHash::is_lt (
    const UIntSeqHash & other ) const [inline]
```

An abbreviation for `cmp(other) < 0`

8.14.2.6 reset()

```
void bliss::UIntSeqHash::reset ( ) [inline]
```

Reset the hash value.

8.14.2.7 update()

```
void bliss::UIntSeqHash::update (
    unsigned int n )
```

Add the unsigned int *n* to the sequence.

The documentation for this class was generated from the following files:

- `src/uintseqhash.hh`
- `src/uintseqhash.cc`

9.3 src/bliss_C.h File Reference

The bliss C API.

```

#include <stdlib.h>
#include <stdio.h>

```

Include dependency graph for bliss_C.h:

Classes

- struct [bliss_stats_struct](#)

The C API version of the statistics returned by the bliss search algorithm.

Typedefs

- typedef struct [bliss_graph_struct](#) **BlissGraph**

The true bliss graph is hiding behind this typedef.

- typedef struct [bliss_stats_struct](#) **BlissStats**

The C API version of the statistics returned by the bliss search algorithm.

9.3.1 Detailed Description

The bliss C API.

This is the C language API to [bliss](#). Note that this C API is only a subset of the C++ API; please consider using the C++ API whenever possible.

9.3.2 Function Documentation

9.3.2.1 bliss_add_edge()

```
void bliss_add_edge (
    BlissGraph * graph,
    unsigned int v1,
    unsigned int v2 )
```

Add a new undirected edge in the graph. *v1* and *v2* are vertex indices returned by `bliss_add_vertex()`. If duplicate edges are added, they will be ignored (however, they are not necessarily physically ignored immediately but may consume memory for a while so please try to avoid adding duplicate edges whenever possible).

9.3.2.2 bliss_add_vertex()

```
unsigned int bliss_add_vertex (
    BlissGraph * graph,
    unsigned int c )
```

Add a new vertex with color *c* in the graph *graph* and return its index. The vertex indices are always in the range `[0,bliss::bliss_get_nof_vertices(bliss)-1]`.

9.3.2.3 bliss_cmp()

```
int bliss_cmp (
    BlissGraph * graph1,
    BlissGraph * graph2 )
```

Compare two graphs according to a total order. Return -1, 0, or 1 if the first graph was smaller than, equal to, or greater than, resp., the other graph. If 0 is returned, then the graphs have the same number vertices, the vertices in them are colored in the same way, and they contain the same edges; that is, the graphs are equal.

9.3.2.4 bliss_find_automorphisms()

```
void bliss_find_automorphisms (
    BlissGraph * graph,
    void(*) (void *user_param, unsigned int N, const unsigned int *aut) hook,
    void * hook_user_param,
    BlissStats * stats )
```

Find a set of generators for the automorphism group of the graph. The hook function *hook* (if non-null) is called each time a new generator for the automorphism group is found. The first argument *user_param* for the hook function is the *hook_user_param* argument, the second argument *N* is the length of the automorphism (equal to `bliss::bliss_get_nof_vertices(graph)`) and the third argument *aut* is the automorphism (a bijection on $\{0, \dots, N-1\}$). The memory for the automorphism *aut* will be invalidated immediately after the return from the hook; if you want to use the automorphism later, you have to take a copy of it. Do not call `bliss_*` functions in the hook. If *stats* is non-null, then some search statistics are copied there.

9.3.2.5 bliss_find_canonical_labeling()

```
const unsigned int * bliss_find_canonical_labeling (
    BlissGraph * graph,
    void(*) (void *user_param, unsigned int N, const unsigned int *aut) hook,
    void * hook_user_param,
    BlissStats * stats )
```

Otherwise the same as [bliss_find_automorphisms\(\)](#) except that a canonical labeling for the graph (a bijection on $\{0, \dots, N-1\}$) is returned. The returned canonical labeling will remain valid only until the next call to a `bliss_*` function with the exception that [bliss_permute\(\)](#) can be called without invalidating the labeling. To compute the canonical version of a graph, call this function and then [bliss_permute\(\)](#) with the returned canonical labeling. Note that the computed canonical version may depend on the applied version of bliss.

9.3.2.6 bliss_get_nof_vertices()

```
unsigned int bliss_get_nof_vertices (
    BlissGraph * graph )
```

Return the number of vertices in the graph.

9.3.2.7 bliss_hash()

```
unsigned int bliss_hash (
    BlissGraph * graph )
```

Get a hash value for the graph.

9.3.2.8 bliss_new()

```
BlissGraph * bliss_new (
    const unsigned int N )
```

Create a new graph instance with N vertices and no edges. N can be zero and [bliss_add_vertex\(\)](#) called afterwards to add new vertices on-the-fly.

9.3.2.9 bliss_permute()

```
BlissGraph * bliss_permute (
    BlissGraph * graph,
    const unsigned int * perm )
```

Permute the graph with the given permutation *perm*. Returns the permuted graph, the original graph is not modified. The argument *perm* should be an array of $N = \text{bliss::bliss_get_nof_vertices}(graph)$ elements describing a bijection on $\{0, \dots, N-1\}$.

9.3.2.10 bliss_read_dimacs()

```
BlissGraph * bliss_read_dimacs (
    FILE * fp )
```

Read an undirected graph from a file in the DIMACS format into a new bliss instance. Returns 0 if an error occurred. Note that in the DIMACS file the vertices are numbered from 1 to N while in the bliss C API they are from 0 to N-1. Thus the vertex *n* in the file corresponds to the vertex *n*-1 in the API.

9.3.2.11 bliss_release()

```
void bliss_release (
    BlissGraph * graph )
```

Release the graph. Note that the memory pointed by the arguments of hook functions for [bliss_find_automorphisms\(\)](#) and [bliss_find_canonical_labeling\(\)](#) is deallocated and thus should not be accessed after calling this function.

9.3.2.12 bliss_write_dimacs()

```
void bliss_write_dimacs (
    BlissGraph * graph,
    FILE * fp )
```

Output the graph in the file stream *fp* in the DIMACS format. See the User's Guide for the file format details. Note that in the DIMACS file the vertices are numbered from 1 to N while in bliss they are from 0 to N-1.

9.3.2.13 bliss_write_dot()

```
void bliss_write_dot (
    BlissGraph * graph,
    FILE * fp )
```

Print the graph in graphviz dot format.
